

# QUANTUM COMPUTATION

## Practice questions

Ashley Montanaro, University of Bristol

ashley.montanaro@bristol.ac.uk

1. **Quantum circuits.** The SWAP gate performs the map  $|x\rangle|y\rangle \mapsto |y\rangle|x\rangle$  for  $x, y \in \{0, 1\}$  and is denoted in a quantum circuit by .

- (a) Write down the matrix corresponding to SWAP with respect to the computational basis and hence, or otherwise, show that SWAP is unitary.
- (b) Show that, for any quantum states of one qubit  $|\psi\rangle, |\phi\rangle$ ,  $\text{SWAP}|\psi\rangle|\phi\rangle = |\phi\rangle|\psi\rangle$ .
- (c) Consider the following quantum circuit, where  $|\psi\rangle, |\phi\rangle$  are arbitrary states of one qubit.

What is the probability that the result of measuring the first qubit is 1 in each of these two cases?

- i.  $|\psi\rangle = |0\rangle, |\phi\rangle = |1\rangle$ .
- ii.  $|\psi\rangle = |\phi\rangle = \frac{1}{\sqrt{2}}(|0\rangle + |1\rangle)$ .

## 2. Grover's algorithm.

- (a) Imagine we would like to solve the unstructured search problem on a set of size  $N$ , where we know that there are  $M$  marked elements, for some  $M$ . Let  $S$  denote the set of marked elements and write  $U_f = I - 2\Pi_S$ , where  $\Pi_S = \sum_{x \in S} |x\rangle\langle x|$ .
- i. Show that  $U_f^2 = I$  and hence that  $U_f$  is unitary.
- ii. Show that, if  $M = N/4$ , the unstructured problem can be solved with one use of the oracle operator  $U_f$ .
- (b) Imagine we apply standard Grover search for a unique marked element, but in fact every element is marked ( $M = N$ ). Does the algorithm succeed? Why or why not?

## 3. The QFT and periodicity.

- (a) Using the formula for a geometric series, or otherwise, write down an expression for  $Q_N^2$  for any  $N$ .

- (b) Run through the steps of the periodicity-determination algorithm for the periodic function  $f : \mathbb{Z}_4 \rightarrow \mathbb{Z}_2$  where  $f(0) = 1$ ,  $f(1) = 0$ ,  $f(2) = 1$ ,  $f(3) = 0$ , choosing an arbitrary measurement outcome in step 3. What is the distribution on measurement outcomes? What is the probability that the algorithm succeeds?

#### 4. Shor's algorithm.

- (a) Assume that we would like to factorise  $N = 33$  and pick  $a = 10$ . Determine the order of  $a \bmod N$  and hence factorise  $N$ .
- (b) Write down the continued fraction expansion of  $17/32$  and the corresponding sequence of convergents.
- (c) Describe all the ways that Shor's algorithm can fail to factorise an integer  $N$ .

#### 5. Phase estimation and Hamiltonian simulation.

- (a) Write down the full quantum circuit for phase estimation with  $n = 3$ , including decomposing the quantum Fourier transform.
- (b) What is the minimal  $k$  such that the Hamiltonian  $H = 2X \otimes X \otimes I - 3Z \otimes I \otimes Z$  is  $k$ -local? What is the minimal  $k$  such that  $H^2$  is  $k$ -local?
- (c) Let  $H$  be a Hamiltonian on  $n$  qubits, and imagine we can produce a state  $|\psi\rangle$  such that  $|\psi\rangle$  is an eigenvector of  $H$  with eigenvalue  $\lambda$ . Describe how phase estimation can be combined with Hamiltonian simulation to approximately determine  $\lambda$ .

#### 6. Noise, quantum channels and error-correction.

- (a) The phase-damping channel  $\mathcal{E}_P$  is described by Kraus operators

$$E_0 = \sqrt{1-p} \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \quad E_1 = \begin{pmatrix} \sqrt{p} & 0 \\ 0 & 0 \end{pmatrix}, \quad E_2 = \begin{pmatrix} 0 & 0 \\ 0 & \sqrt{p} \end{pmatrix}$$

for some  $p$  such that  $0 \leq p \leq 1$ .

- i. What is the result of applying  $\mathcal{E}_P$  to a mixed state  $\rho$  of the form

$$\rho = \begin{pmatrix} \alpha & \beta \\ \beta^* & \gamma \end{pmatrix}$$

in the computational basis?

- ii. Determine the representation of  $\mathcal{E}_P$  as an affine map  $v \mapsto Av + b$  on the Bloch sphere.
- (b) Imagine we encode the state  $\alpha|0\rangle + \beta|1\rangle$  using the bit-flip code (i.e.  $|0\rangle \mapsto |000\rangle$  and  $|1\rangle \mapsto |111\rangle$ ) and a  $Y$  error occurs on the second qubit. What is the decoded state?
